

1. All the test cases have been compiled and organized within Excel files. Each file contains multiple sheets, with each sheet dedicated to a distinct test scenario, ensuring clear separation and structured documentation.
2. The UI automation testing has been implemented using Selenium as the automation framework, with Python as the scripting language as mentioned.
3. The answers to the given tasks have been documented separately in individual files. Each file is named according to the specific task it addresses, making it easy to locate and reference the required information.
4. The collection of API test cases executed using Postman has been shared within a designated folder. Collection is saved under a file name corresponding to its related task.
5. The performance testing scripts and results generated using JMeter have also been included in the shared folder.
6. Both online and offline versions of all test-related documents have been compiled and stored in a folder named "Assignment Task."
